AMITY TECHNOLOGY, LLC LIMITED WARRANTY FOR NEW PRODUCTS

- 1. General Provisions.** This Warranty shall apply to the original purchaser of (1) any new and unused machine manufactured by Amity Technology, LLC ("Amity"), and (2) any new and unused part which is manufactured by Amity for use in an Amity machine, jointly referred to as "Products," whether such Product is purchased through a dealer or directly from Amity. Under this Warranty, Amity will repair or replace, as it chooses in its sole discretion, any covered Product, or any component thereof, which Amity determines to be defective. This Warranty shall be in effect for a period of twelve (12) months ("the Warranty Period"), beginning on the date of delivery of the covered machine or part by the dealer or Amity to the purchaser ("the Warranty Start Date"). The purchaser must pay the cost of transportation of a Product to be repaired or replaced to and from an authorized Amity dealer. This Warranty may not be transferred from the original purchaser of a Product to any other person. This Warranty does not give a purchaser the right to any relief other than repair or replacement of the Product, and it specifically does not allow for consequential or incidental damages, exemplary or punitive damages, or costs and fees.
- 2. Scope and Limitations of Warranty.** With respect to machines, this Warranty is void if any part not supplied by Amity is used in assembly or repair of the machine, or if the machine has been altered, abused or neglected, as determined by Amity. With respect to parts, this Warranty is void if the part is used in any manner other than that for which it is intended. This Warranty does not extend in any way to tires and any other component of a Product warranted by another manufacturer, a copy of which warranty is provided herewith ("Third-Party Warranties"). In the event Amity determines that a Product is not defective, or that any other provision of this Paragraph 2 operates to limit the Warranty, this Warranty shall not apply and the purchaser shall be responsible for transporting the Product from the authorized Amity dealer's location within 10 days of notice by Amity.
- 3. Procedures for Obtaining Service.** To secure Warranty service, a purchaser must (1) report the defect to an authorized dealer and request repair within 45 days of the failure and within the Warranty Period; (2) present evidence that this Warranty applies to the Product; (3) present evidence of the Warranty Start Date; and (4) bring the Product to an authorized Amity dealer within a reasonable period of time after reporting the defect.
- 4. LIMITATION OF IMPLIED WARRANTIES AND OTHER REMEDIES.** To the extent allowed by law, neither Amity, its dealers, nor any company affiliated with Amity makes any warranties, representations, or promises as to the quality, performance, or freedom from defect of any Product covered by this Warranty.

AMITY HEREBY WAIVES, TO THE EXTENT APPLICABLE, ANY AND ALL IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. A PURCHASER'S ONLY REMEDIES IN CONNECTION WITH THIS WARRANTY ARE THOSE SET FORTH ON THIS PAGE. IN NO EVENT WILL AMITY, ITS DEALERS, OR ANY COMPANY AFFILIATED WITH AMITY BE LIABLE FOR INCIDENTAL, CONSEQUENTIAL OR PUNITIVE DAMAGES.

Some states do not allow waivers of certain warranties, so the above waivers may not apply to you. You may also have other rights which vary from state to state.

- 5. No Dealer Warranty.** This is the exclusive warranty applicable to Amity Products. No dealer has any authority to make any other warranty, modify, limit, or expand the terms of this Warranty in any fashion, or make any representation or promise on behalf of Amity.
- 6. Dispute Resolution.** Any controversy or claim arising out of or relating to this Warranty must be settled by arbitration in Fargo, North Dakota, at a time and location designated by the arbitrator, but not exceeding 30 days after a demand for arbitration has been made, and may be conducted by electronic, video, or other technical means. Arbitration will be conducted by the American Arbitration Association in accordance with its Rules of Commercial Arbitration, and judgment upon the award rendered by the arbitrator may be entered in any court having jurisdiction thereof. The arbitrator will have the authority to order Amity to undertake a repair or replace any Product, at its election, if the arbitrator finds that this Warranty requires Amity to do so. The arbitrator will not have the authority to impose any other remedy against Amity, including without limitation consequential or incidental damages, exemplary or punitive damages, or costs and fees.

PRECAUTIONS

SAFETY FIRST

The purpose of this manual is to assist you in safely operating and maintaining your Amity Technology equipment. It is the responsibility of the owner to ensure that any operator takes the time to thoroughly read and understand the information given.

It is not possible to overstate the importance of safety. Serious injury or death can result from improper operation of any farm equipment. We have taken great care to point out potential hazards that require special consideration.

Give all precautions and warnings the attention they deserve. The following symbol is used throughout the manual to alert you to them.

WARNING

ALWAYS know your equipment, **Read owners manual** before operating.

DO NOT allow anyone to ride on drill.

ALWAYS install wing locks and transport stops when transporting drill.

ALWAYS use adequate tow vehicle. Drill tongue weight and tongue lift can exceed 1,500 pounds.

ALWAYS remember to properly secure safety chain.

DO NOT Transport over 20 MPH (32 KmPH).

DO NOT disconnect from tractor or other towing vehicle when the toolbar is tilted forward and the openers are off the ground and the wings have been lowered. There will be a tongue lift force in that condition. The toolbar should be tilted back so that openers are on the ground to help offset the tongue lift force. If disconnecting from the tractor or other towing vehicle with the machine in the transport position, be aware of the high tongue loads.

DO NOT modify or alter this equipment without first contacting Amity Technology, LLC.

CAUTION

DO NOT work under drill without blocking hydraulic cylinders.

ALWAYS keep decals free of dirt and replace if they become damaged. See parts section for proper placement.

ALWAYS avoid high-pressure fluids. Use a piece of cardboard to search for suspected hydraulic leaks.

FIELD PREPARATIONS

REPHASING HYDRAULIC CYLINDERS

The depth control cylinders on the Air Double Disk Drill are built with rephasing ports in the fully extended position. These ports allow the cylinders to bypass oil when the tractor hydraulic control is held in the raised position. This will completely fill/extend cylinders in the system to insure they are at the same level. To properly rephase the depth control cylinders, use the following procedure.

1. Raise drill until cylinders are fully extended. Continue holding lever for several seconds to allow cylinders that are out of phase to fully extend. (Figure 1)
2. Return hydraulic lever to neutral for several seconds to allow the cylinders to settle past rephasing ports. (Figure 2)
3. Install desired amount of depth control stops on every cylinder. (Figure 3)

Note: All cylinders must have an equal amount of depth control stops. Leveling can not be accomplished by using different amounts of stops on different cylinders. See Leveling Section.

4. Retract cylinders until they rest on depth control stops. With the same amount of stops on each cylinder, the cylinders should be resting on the stops. If not, rephase the cylinders again. If they still do not rest on stops, see Adjusting Depth Control Cylinders Section.

Figure 1

Figure 2

Figure 3

ADJUSTING DEPTH CONTROL CYLINDERS

The depth control cylinders, with the same stops in each cylinder, should rest on the stops when retracted. If the cylinders do not rest on the stops, use the following procedure.

1. Check for proper cylinder size, location and sequence. (Figure 4)
2. Check tractor hydraulic fluid level. If rephasing process is performed with a low tractor reservoir, there is a chance of drawing air into the system.
3. Check that the cylinders are free of air by performing the rephase cycle. If air is trapped in any cylinder, the affected cylinder will have a spongy erratic movement. Move the control lever to raise position and hold for 60 to 90 seconds after the cylinders are fully extended. Repeat rephasing cycle until cylinder is free of air.
4. If cylinder is air free and a $1/16$ " to $1/8$ " gap is present between stops and cylinder clevis, remove pin holding cylinder rod end, loosen set screw on clevis and adjust clevis down on cylinder rod until the clevis clamps the cylinder stops. Retighten setscrew on clevis and reattach cylinder.
5. If a gap of $1/4$ " to $1/2$ " exists, look for a cylinder in the wrong location, a cylinder that may be mislabeled, or a leaking cylinder in the system.

Figure 4

Figure 5

LEVELING

The leveling of the Air Double Disk Drill is a two step process.

Step 1:

The main frame leveling is accomplished by adjusting the location of the hitch on the front of the drill. Adjust the hitch up or down, using the different holes provided for front to rear leveling. It is required that the hitch be placed in the holes that will allow pulling from the tractor drawbar as level as possible. (Figure 6)

Figure 6

Step 2:

Level the wing frame by adjusting the front caster on the wing. Measure the wings at the outer end of the wing. The measurement should match the main frame measurement taken at the center of the main frame. The caster mounting bracket may need to be adjusted up or down slightly to allow wing to run level in field operating conditions. (Figure 7)

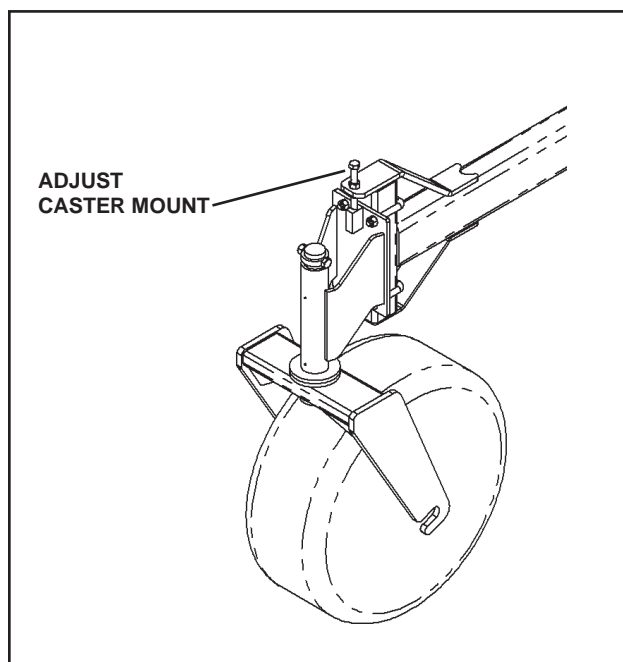

Figure 7

TIRES AND RIMS

1. Inflate main frame tires to 36 PSI. Torque lug nuts to 130 foot pounds.

Check lug bolt tightness after first 10 hours of operation.

2. Inflate wing caster tires to 36 PSI. Torque lug nuts to 110 foot pounds.

Check lug bolt tightness after first 10 hours of operation.

WING LIFT

NOTE: ALWAYS STAY CLEAR OF WING AREA WHEN RAISING OR LOWERING WINGS.

BEWARE OF OVERHEAD ELECTRICAL WIRES WHILE TRANSPORTING AIR DOUBLE DISK DRILL OR RAISING WINGS.

1. Always use wing locks when folding wings for transporting drill. Always unlock wings prior to unfolding wings. Failure to unlock wings can cause serious damage to drill frame. (Figure 8)
2. The tool bars should be tilted forward to lift the row units off the ground before lifting or lowering the wings. This eliminates any sliding and side loading of row units near wing hinges.
3. When lowering wings, hold control lever until wing lift cylinders have fully extended to allow wings to follow ground contour.

TRANSPORTING

WARNING! DO NOT TRANSPORT OVER 20 MPH (32 KmPH)

Figure 8

OPENERS

DOWN PRESSURE

Down pressure on each individual row unit can be adjusted by moving the quick attach cotter pin to a different hole location in the down pressure spring rod. For average operating conditions, the suggested initial location for the quick pin is in the second hole from the bottom of the spring rod. Openers operating in wheel tracks, particularly tractor wheel tracks, should normally be set with the quick pin in the third hole from the bottom. If field conditions require less down pressure, the quick pin can be moved to an adjustment hole closer to the bottom of the spring rod. Conversely, if more down pressure is required, the quick pin can be moved to a higher adjustment hole. (Figure 9)

The rotating tool bar should normally be operated at a position approximately parallel or level with the ground. However, it is possible to change the down pressure on all of the openers by tilting the tool bar forward or back.

Tilting the bar forward reduces the down pressure, while tilting the bar back increases the down pressure.

Figure 9

SEED DEPTH

Setting the seeding depth of the openers is accomplished by moving the "Knob" located near the press wheel. A suggested starting point for setting the "Knob" is in the middle notch on the adjustment quadrant.

Moving knob forward, increases seeding depth.

Moving knob to the rear, decreases seeding depth.

1 notch = 1/4 inch change in depth.

If the tool bar is tilted forward or back after the original depth setting, the seeding depth may change. Tilting the bar forward reduces down pressure and thus may result in shallower seeding depth. For example, this feature is useful when desiring to plant at a shallow depth with low down pressure.

Tilting the bar back increases down pressure which may result in an increased seeding depth.

REPLACING DISC OPENERS

(Figure 10)

To replace worn or damaged discs do the following:

NOTE: *The 14 inch (356 mm) disc should be replaced after wear use of disc reaches 13-1/2 inch (343 mm) diameter.*

1. Remove the dust cap from the disc assembly.
2. Remove the disc bolt (the left disc bolt has LH threads).
3. Remove the disc assembly and install the new disc assembly.
4. Tighten the disc bolts to a torque of 40 to 50 lb ft (54 to 68 Nm).
5. Clean the dust cap and apply Loctite 277 to the entire circumference of the dust cap. **DO NOT** allow the Loctite into the bearing area.
6. Install the dust cap and turn 90 degrees to ensure complete adhesion.

IMPORTANT: *DO NOT exceed the bolt torque specification.*

DISC & SCRAPER ADJUSTMENT

The scraper nut should be tightened just until scrapers contact disc blades.

Special Note: Shim washers are needed behind discs for proper spacing. You should be able to spin one disc while holding the other disc stationary with scrapers properly adjusted.

Figure 10

MAINTENANCE

LUBRICATION

Lubricate grease fittings with SAE multi-purpose grease at intervals shown. (Figure 11)

Figure 11

GENERAL

Check tightness of all bolts periodically. When replacing bolts, be sure they are replaced with bolts of equal strength.

HYDRAULIC LINKAGE

Inspect all wing lift and depth control linkage every 50 hours. Replace lost or worn pins and keepers. (Figure 12)

Figure 12

STORAGE

Brush SAE multi-purpose grease on all exposed cylinder rods. Clean accumulated grease and dirt from shaft seal and fittings.

Clean entire drill thoroughly to remove dirt and trash, which would hold moisture and cause rusting.

Clean ground openers thoroughly to remove any fertilizer residue.

Check air pressure of all tires. Inflation pressure should be 36 psi for the main frame and wing tires.

Check for any worn or broken parts and order replacements.

TROUBLESHOOTING

PROBLEM	POSSIBLE CAUSE	SOLUTION
Wings will not lift.	Inadequate tractor pressure.	Adjust tractor pressure to minimum of 2500 PSI (Consult qualified service personnel for your make of tractor.)
Hydraulic cylinders not coming down to stops.	Different amount of stops on cylinders.	Install equal amounts of depth stops on each cylinder.
	Cylinder out of phase.	Rephase cylinders. See instructions for rephasing procedure.
	Tractor hydraulic level is low.	Fill tractor reservoir.
	Air in hydraulic system.	Rephase cylinders.
Depth cylinders all settling together.	Tractor valve leaking.	Repair tractor valve.
One cylinder settling out of sequence.	Cylinder leaking internally.	Repair cylinder.
Discs not rotating.	The disc scrapers may be too tight.	Adjust scrapers.
	Discs running too tight together.	Add shim to one or both discs as needed. You should be able to turn one disc by hand while holding the other disc stationary.
Plugging of grain tubes and openers.	Allow the drill to rock back when stopping or backing the drill with furrow openers in the ground.	Raise the drill before stopping or backing the drill.
Bunching or skipping of grain.	Inside disc scrapers on furrow openers too tight, retarding disc rotation.	Adjust scrapers.
	Discs not rotating in very dry, loose soil.	Correct this action by adjusting inside scrapers.
	Discs may be warped or have excessive wobble.	If edge of disc moves in and out by more than 1/8 inch (3 mm) in 180 degrees rotation, replace that disc.
